

Abstract

The invention concerns an assisting device for unfolding an inflatable airbag (3), located at the junction of at least two fitting elements of a motor vehicle body parts, whereof the first (10) of said fitting elements is fixed and the second (20) is designed to be deformed under the pressure exerted by said inflatable airbag (3) when it moves. The invention is characterised in that a guiding surface (12) of an outlet zone (5) of said inflatable airbag (3) oriented towards an end portion (23) of said second fitting element (20), is located at the outer limit of a co-operating zone between the first (10) and second (20) fitting elements.
